                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a self-replicating hepatitis C virus (HCV) CC polymucleotide molecule comprising a 5'-non translated region (NTR), cc where guanine at position 1 is substituted for adenine, a HCV polyprotein cc region coding for a HCV polyprotein, and a 3'-NTR region. The self-replicating Hepatitis C virus (HCV) RNA molecule is useful for evaluating potential inhibitors of HCV replication. The HCV RNA molecule is also cueful for efficiently establishing cell culture replication. The self-replicating polymucleotide molecule contains a 5'-NTR, where G at position 1 is substituted for A, and therefore provides an alternative to conjunction with mutations in the HCV non-structural region, such as the CC (2042) C/R mutations, transduces and/or replicates with greater cc efficiency. This amino acid sequence is encoded by the hepatitis C virus replicates NS2/3, procease complex CC NS3/4, helicase NS3 and RNA-dependent RNA polymerase NS5B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Best Local Sim: Matches 366;

The invention describes a self-replicating hepatitis C virus (HCV) polymucleotide molecule comprising a 5'-non translated region (NTR), where guanine at position 1 is substituted for adenine, a HCV polyprotein region coding for a HCV polyprotein, and a 3'-NTR region. The self-replicating Hepatitis C virus (HCV) RNA molecule is useful for evaluating potential inhibitors of HCV replication. The HCV RNA molecule is also useful for efficiently establishing cell culture replication. The self-replication is substituted for A, and therefore provides an alternative to position 1 is substituted for A, and therefore provides an alternative to conjunction with mutations in the HCV non-structural region, such as the G(2042) C/R mutations, transduces and/or replicates with greater efficiency. This amino acid sequence represents a mutant of the hepatitis C virus replicase NS3/4, helicase NS3 and RNA-dependent RNA polymerase NS2/3, protease complex NS3/4, helicase NS3 and RNA-dependent RNA polymerase NS5B. Note: This sequence shown in ABG30580 using information given in the claims of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

genome polyprotein - hepatitis C virus (strain J)
N;Contains; capsid protein C; envelope protein M; major envelope protein E; nonstructural protein NS4a; nonstructural protein NS4b; nonstructural protein NS5
C;Species: hepatitis C virus
C;Date: 30-Jun-1992 #sequence_revision 30-Jun-1992 #text_change 19-Jan-2001
C;Accession: A39253; PS0086

R;Kato, N.; Hijikata, M.; Cotsuyama, Y.; Nakagawa, M.; Ohkoshi, S.; Sugimura, Proc. Natl. Acad. Sci. U.S.A. 87, 9524-9528, 1990
A;Title: Molecular cloning of the human hepatitis C virus genome from Japanese A;Reference number: A39253, MUID:91088550; PMID:2175903
A;Recession: A39253

from Japanese patients v

T.; Shimoto

probable transport A;Molecule type: genomic RNA
A;Residues: 2650-2707 <kR2>
A;Residues: 2650-2707 typanese isolate
A;Reparimental source: Japanese isolate
C;Comment: The cleavage sites of this polyprotein have not been determined.
C;Superfamily: hepatitis C virus genome polyprotein
C;Superfamily: hepatitis C virus genome polyprotein
C;Reywords: ATP; glycoprotein; hydrolase; nucleotide binding; P-loop; polyprotein; serine

                                                                                                                                                                                                                                                                                                                                                                                                Hepacivirus.
          SUBUNIT: The virion of this virus is a nucleocapsid covered by lipoprotein envelope. The envelope consists of two proteins: protein M and glycoprotein E. The nucleocapsid is a complex of protein C and mRNA.

SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1114

SUBUNIT: The virion of this virus is a nucleocapsid covered by lipoprotein envelope. The envelope consists of two proteins: protein M and glycoprotein E. The nucleocapsid is a complex of protein C and mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            protein C and mRNA.
SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY 829.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       U39

Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein E1 (G932) (G935); Envelope glycoprotein E2 (G968) (G970) (NS1); Protein P7; (N935); Envelope glycoprotein E2 (G968) (G970) (NS1); Protein P7; (N935) (P70) (Hepacivirin)
(EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS4A (P4); Nonstructural protein
NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein
NS4B (P27); (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate EX) (HCV).
Viruses, SSNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                           POLG HCVBK

-!- FUNCTION: The small proteins NS2A, NS2B, NS4A and NS4B are
hydrophobic, suggesting a possible membrane-related function
and NS5 may play a role in the viral RNA replication.
-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the
                                                                                                                                                                                                                  Transmembrane; Nonstructural
3D-structure.

SUBUNIT: The virion of this virus is a nucleocapsid covered by lipoprotein envelope. The envelope consists of two proteins: protein M and glycoprotein E. The nucleocapsid is a complex of protein C and mRNA.

SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1A1V; 16-FEB-99.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                K-RAY CRYSTALLOGRAPHY (2.2 ANGSTROMS) OF 1192-1657.
                                                                                                                                                                                                      precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in P1 and Ser or Ala in P1.
CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate
{RNA}(N).
SUBUNT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED B
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
AND E3. THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY
PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED SY
PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASE FAMILY U39.
SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           256; PubMed=1658800;

Proma human carrier: comparison with reported isolates for contained the sequence of the genomic RNA of hepatitis C virus in the viral RNA reported isolates for contained the sequence of the genomic NS2A, NS2B, NS4A and NS4B are contained to the sequence of four peptide bonds in the procursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosph (RNA)(N).

C -!- SUBUNIT: The virion of this virus is a nucleocapsid covered the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of t

Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
Genome polyprotein E1 (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein Protein NS3 (P70) (Hepactvirin)
(EC 3.4.21.98); Nonstructural protein NS4A (P4); Nonstructural protein
NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein
NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Heparitis C virus (isolate HC-J8) (HCV).
Heparity SRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                               the European Bioinformatics Institute.                                                                                                                                                                                                                                                                                                                        SUBUNIT: The virion of this virus is a nucleocapsid covered by lipoprotein envelope. The envelope consists of two proteins: protein M and glycoprotein E. The nucleocapsid is a complex of protein C and mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                               FUNCTION: The small proteins NS2A, NS2B, NS4A and NS4B are hydrophobic, suggesting a possible membrane-related function. and NS5 may play a role in the viral RNA replication. CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viprecursor polyprotein, commonly with Asp or Glu in the P6 position. Cys or Tar in p1 and Ser or Ala in P1'.

CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1123

-i- FUNCTION: May target chloroplast proteins to eithe:
or envelope membranes.

-i- SUBCELLULAR LOCATION: Chloroplast stroma.
-i- TISSUE SPECIFICITY: Most abundant in green shoot t:
lower levels seen in the roots and etiolated buds.
-i- SIMILARITY: Belongs to the GTP-binding SRP family.
                                                                                                                                                                                                                                           SMART; SM00382; AAA; 1.

-!- SUBCELLULAR LOCATION: Membrane-bound.
-!- DEVELOPMENTAL STAGE: Expressed in the insect stage (promastigote)
but not in the mammalian host stage of the parasite life cycle.
-!- SIMILARITY: Belongs to the adenylyl cyclase class-3 family.

Submitted (NOV-1999) to the EMBL/GenBank/DDBJ databases.
Submitted (NOV-1999) to the EMBL/GenBank/DDBJ databases.
IS UBLUIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MENNA (BY SIMILARITY).

SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEARSID COVERED BY
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSIGTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA (BY SIMILARITY).

"Hepatitis C virus (HCV) genotype 1b sequences from fifteen patients at "Hepatitis C virus (HCV) genotype 1b sequences from fifteen patients at the hepatocellular carcinoma: the 'progression score' revisited.";

Submitted (SEP-2000) to the EMBL/GenBank/DDBJ databases.

CC PROTEIN GENELON OF THIS VIRUS IS A NUCLEOCAPSID EN A LIPOPROTEIN ENVELOPE. THE SUNGLOPE CONSISTS OF TWO PROTEINS:

CC PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF THE PROTEIN GRAPH AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF THE PROTEIN FOR PROTEIN GAND MRNA (BY SIMILARITY).
